We introduce the problem of discovering **particular contexts** and **collections of individuals** such that their **pairwise behavior** exceptionally differs from their usual one

We introduce the problem of discovering **particular contexts** and **collections of individuals** such that their **pairwise behavior** exceptionally differs from their usual one

Find the **top-k three-set patterns** (c, g', g'') w.r.t. some quality measure φ

We introduce the problem of discovering **particular contexts** and **collections of individuals** such that their **pairwise behavior** exceptionally differs from their usual one

Find the **top-k three-set patterns** (c, g', g'') w.r.t. some quality measure φ

Context

definition by **intent** of a **subset of items**

We introduce the problem of discovering **particular contexts** and **collections of individuals** such that their **pairwise behavior** exceptionally differs from their usual one

Find the **top-k three-set patterns** (\underline{c}, g', g'') w.r.t. some quality measure φ

Context

definition by **intent** of a **subset of items**

$g' \& g''$

definition by **intent** of a **subset of individuals**

We introduce the problem of discovering **particular contexts** and **collections of individuals** such that their **pairwise behavior** exceptionally differs from their usual one

Find the **top-k three-set patterns** (c, g', g'') w.r.t. some quality measure φ

Example:

(Consumer Protection in General Ballots voted in between 2015 and 2016 , German Deputies, Italian Deputies)

We observe a **significant decrease of pairwise agreement**

Contextual pairwise behavior

Comparison between models

Use of quality measure

$\varphi_{consent}$: to uncover contexts that leads to more agreement

$\varphi_{dissent}$: to uncover contexts that leads to more disagreement

$$\varphi_{dissent} = \frac{\sum_{(i,j) \in \gamma_L(U_{gI}) \times \gamma_L(U_{gII})} \max(\text{sim}(E, i, j) - \text{sim}(E_{context}, i, j), 0)}{|\gamma_L(U_{gI})| \times |\gamma_L(U_{gII})|}$$

- DSC (Discovering similarities change) Framework
- **DSC algorithm**
- Use cases

Enumerating candidate subgroups:

In order to traverse the search space efficiently while having the guarantees to **obtain the real top k patterns** we need to:

- Efficiency of enumeration
(Enumerate each subgroup only once)
- Effectiveness of pruning techniques: Prune unpromising sub-search space ASAP.

Enumerate each subgroup at most once

Enumerating candidate subgroups:

In order to traverse the search space efficiently while having the guarantees to **obtain the real top k patterns** we need to:

- Avoid redundancy in Enumeration: take benefit of closed descriptions and impose a canonical order between descriptions.
- Prune unpromising sub-search space ASAP: define upper bounds and propose a branch and bound algorithm

a) Closed descriptions: We defined a **closure operator over a complex description** (different types of attributes) **relying on closure over each attribute** (Boolean, Categorical, numerical*)

*M. Kaytoue, S. O. Kuznetsov, A. Napoli, and S. Duplessis. Mining gene expression data with pattern structures in formal concept analysis. *Information Sciences*, 181(10):1989{2001, 2011.

a) Closed descriptions: We defined a **closure operator over a complex description** (different types of attributes) **relying on closure over each attribute** (Boolean, Categorical, numerical*, **HMT**)

- **New pattern domain**: HMT (**Hierarchical Multi-tag attribute**) relying on pattern structures[†]

^{*}M. Kaytoug, S. O. Kuznetsov, A. Napoli, and S. Duplessis. Mining gene expression data with pattern structures in formal concept analysis. Information Sciences,181(10):1989{2001, 2011.

[†]Ganter, B., & Kuznetsov, S. (2001). Pattern structures and their projections. Conceptual Structures: Broadening the Base, 129-142

New pattern domain: HMT (**Hierarchical Multi-tag attribute**) relying on pattern structures

<i>Items (Ballots) - E</i>	
<i>IdBallot</i>	<i>Theme (HMT)</i>
001	1.10 Justice 2.10 Europe coop
002	1.10 Justice 2.20 Europe inter.
003	2.30 Consumer Protection 3.10 Agriculture
004	3.10 Agriculture

European Parliament Datasets: 378 Tags

<i>Items (Places) - E</i>	
<i>IdPlace</i>	<i>Theme (HMT)</i>
130	07.24.03. Session Photography 14.38. IT Services & Computer Repair
2012	09.39 Grocery 22.19 Drugstores
4231	21.24 Breakfast & Brunch 21.26 Buffets
31425	09.03 Bagels 09.15 Coffee & Tea

YELP: 1509 Tags

HMT (Hierarchical Multi-tag attribute) Descriptions (Conjunction of tags)

$d = \{2\}$ | $d' = \{g1, g3, g4\}$

$d = \{1,2\}$ | $d' = \{g1, g3\}$

	<i>tags</i>
g_1	{1.20, 2.10}
g_2	{1, 3}
g_3	{1.10, 2.10, 3}
g_4	{2.10}
g_5	{1.20}

1.20, 2.10 : explicit tags
1, 2, * : implicit tags

ALGORITHM – HANDLING HMT

HMT (Hierarchical Multi-tag attribute) Descriptions (Conjunction of tags)

$d = \{2\}$ | $d' = \{g1, g3, g4\}$

$d = \{1,2\}$ | $d' = \{g1, g3\}$

Pattern Ordinal Scaling

	tags
g_1	{1.20, 2.10}
g_2	{1, 3}
g_3	{1.10, 2.10, 3}
g_4	{2.10}
g_5	{1.20}

Take into account the taxonomy T

	*	1	1.10	1.20	2	2.10	3
g_1	×	×		×	×	×	
g_2	×	×					×
g_3	×	×	×		×		×
g_4	×				×	×	
g_5	×	×		×			

Ignore the taxonomy T

Pattern Structure[†] $(G, (D, \sqcap), \delta)$

G : a set of objects

D : Domain of descriptions (*Conjunction of tags*)

\sqcap : Infimum (*Similarity Operator*), (D, \sqcap) forms a semi-lattice, the partial order denoted \sqsubseteq . We have $c \sqsubseteq d \Leftrightarrow c \sqcap d = c$

δ : A mapping function $\delta: G \rightarrow D$

[†] Ganter, B., & Kuznetsov, S. (2001). Pattern structures and their projections. Conceptual Structures: Broadening the Base, 129-142

	tags
g_1	{1.20, 2.10}
g_2	{1, 3}
g_3	{1.10, 2.10, 3}
g_4	{2.10}
g_5	{1.20}

ALGORITHM – HANDLING HMT

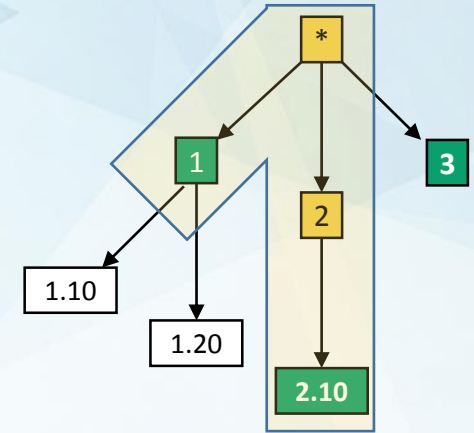

Defining the *infimum*
(similarity) operator for (D, \sqcap)

Whole hierarchy

Description $c = \{1.20, 2.10\}$

Description $d = \{1, 2.10, 3\}$

$c \sqcap d = \{1, 2.10\}$

Defining the *infimum*
(similarity) operator for (D, Π)

Whole hierarchy

Infimum Π_{HMT} definition

Given c, d two descriptions from D :

- $c \Pi_{HMT} d = \max(\cup_{t \in c} \uparrow t \cap \cup_{u \in d} \uparrow u)$
- $\max(s) = \{t \in s \mid (\downarrow t - \{t\}) \cap s = \emptyset\}$

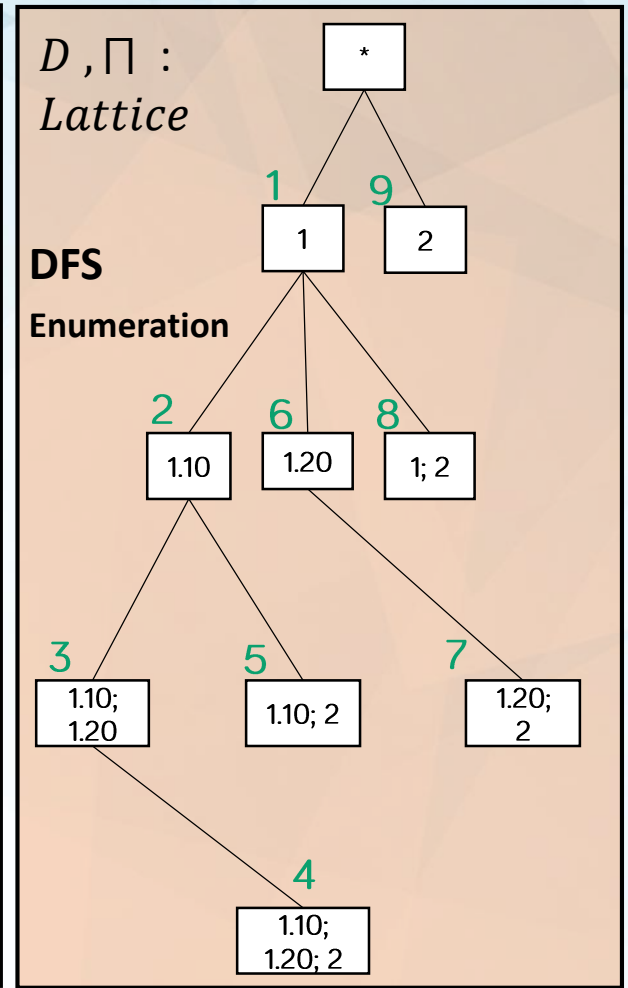

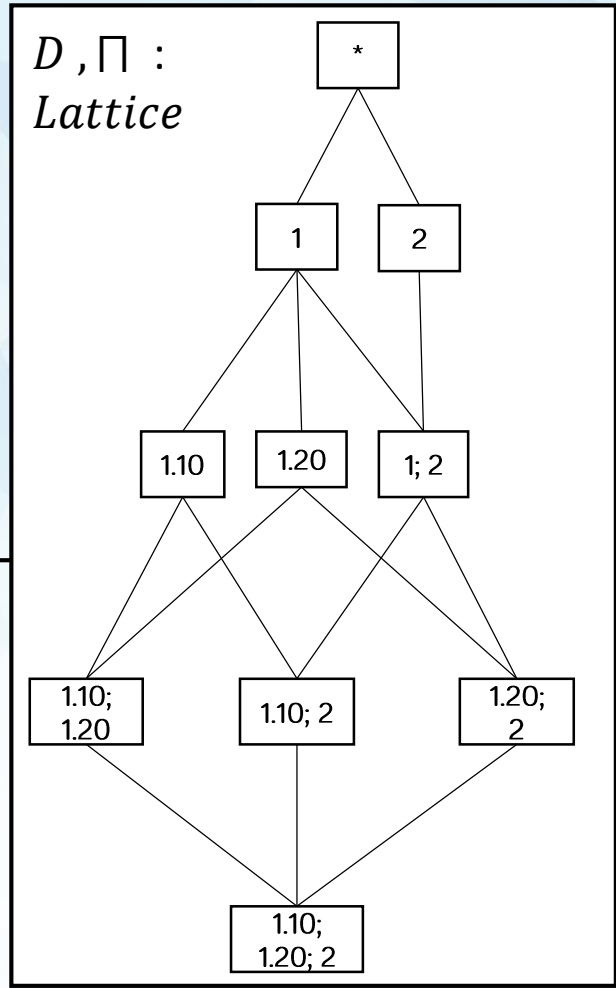

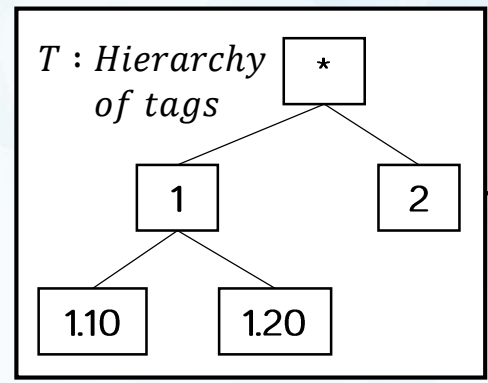

$$c \Pi d = \{1, 2.10\}$$

Allows us to define
straightforwardly a
closure operator over
HMT descriptions

ALGORITHM – HANDLING HMT

Enumerating pattern using hierarchical Structure of tags T .

Perf example : CbO

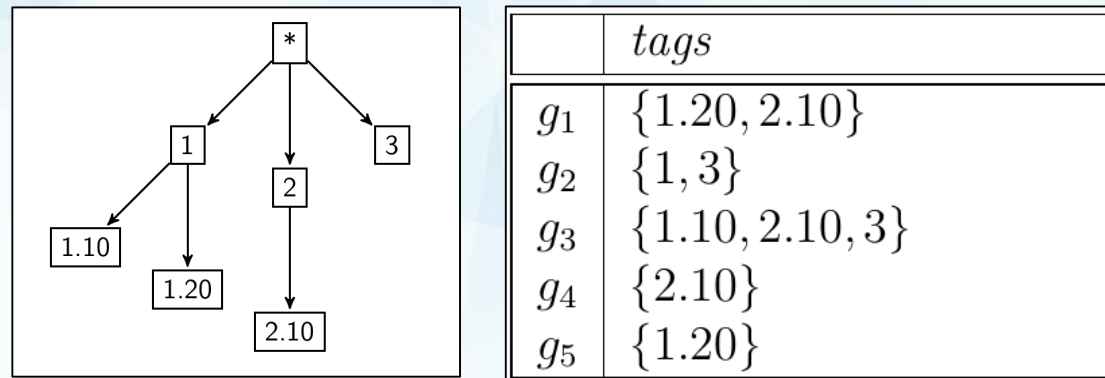

(155 tags, max_tags_by_obj=3, 100 objects, depth=3, 5-ary)

Itemset (Scaling): 12737 visited for 243 closed

HMT: 1823 visited for 243 closed

a) Closed descriptions: We defined a **closure operator over a complex description** (different types of attributes) **relying on closure over each attribute** (Boolean, Categorical, numerical*, HMT)

- **New pattern domain:** HMT (**Hierarchical Multi-tag attribute**) relying on pattern structures[†]

*M. Kaytoug, S. O. Kuznetsov, A. Napoli, and S. Duplessis. Mining gene expression data with pattern structures in formal concept analysis. Information Sciences,181(10):1989{2001, 2011.

[†] Ganter, B., & Kuznetsov, S. (2001). Pattern structures and their projections. Conceptual Structures: Broadening the Base, 129-142

a) Closed descriptions: We defined a **closure operator over a complex description** (different types of attributes) **relying on closure over each attribute** (Boolean, Categorical, numerical*, **HMT**)

- **New pattern domain**: HMT (**Hierarchical Multi-tag attribute**) relying on pattern structures[†]
- Adapt **CbO (close-by-one^{**})** algorithm to enumerate candidate subgroups in a DFS fashion (**Without redundancy**)

^{**} S. O. Kuznetsov. Learning of simple conceptual graphs from positive and negative examples. In PKDD, pages 384{391. Springer, 1999.

^{*}M. Kaytue, S. O. Kuznetsov, A. Napoli, and S. Duplessis. Mining gene expression data with pattern structures in formal concept analysis. Information Sciences,181(10):1989{2001, 2011.

[†] Ganter, B., & Kuznetsov, S. (2001). Pattern structures and their projections. Conceptual Structures: Broadening the Base, 129-142

b) Branch and bound algorithm: definition of upper bounds on both quality measures for a more efficient enumeration.

b) Branch and bound algorithm: definition of upper bounds on both quality measures for a more efficient enumeration.

- Evaluate the upper bound $ub(p)$ of each generated subgroup p (by adapted CbO)
- If $ub(p) < \sigma_\varphi$ then backtrack and do not consider all the sub search space of p i.e. $\{p' \in D \mid p \sqsubset p'\}$
- We defined two upper bounds of the quality measure:
 - UB1 less tight but not costly
 - UB2 tighter but costly

EXAMPLE: EUROPEAN PARLIAMENT DATASET

Usual pairwise behavior

Toward **consent** between European political groups
The pattern:

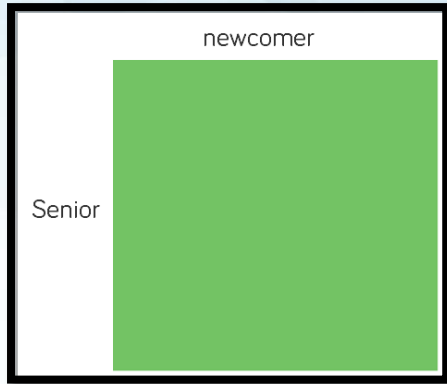

[7.40 European judicial conventions during Feb. – Nov. 2015 ,left wing ,right wing]

Contextual pairwise behavior

EXAMPLE: YELP DATASET

Usual pairwise behavior

Toward **Dissent** between Yelp Users for the context:

[Professional Services, Shopping,
In Oklahoma, Senior, Newcomer]

Contextual pairwise behavior

Toward **Dissent** between Yelp Users for the context:

[Medical Center, Doctors,
In Wisconsin, {Senior},
{Intermed., Newcomer,}]

Conclusion & Perspectives

Conclusion

- ◇ Definition of a novel problem :
discovering exceptional pairwise behavior
- ◇ Implementation of a branch and bound
enumeration algorithm (DSC)
- ◇ Experimentation over real-world
datasets (voting and rating)

Conclusion

- ◇ Definition of a novel problem : discovering exceptional pairwise behavior
- ◇ Implementation of a branch and bound enumeration algorithm (DSC)
- ◇ Experimentation over real-world datasets (voting and rating)

Perspectives & current work

- ◇ Providing adapted instant mining and interactive mining algorithms.
- ◇ Studying the behavior of groups of individuals (deputies) through time.
- ◇ ContentCheck: Offering a set of tools for journalists (Le Monde) of lead finding/fact checking
- ◇ Extend HMT to handle datasets where implications between items are known.
