A. Zimmermann Constraints on Pattern Sets

・ロト ・聞 ト ・ 聞 ト ・ 聞 トー

- Mining process finished
- Result: patterns and/or rules
- Question: How to select subsets?
- Answer: Constrain the sets!
- Question: How?

Types of constraints (I can think of)

Syntactic constraints

- Size
- Which patterns allowed (possibly dependent on already included ones)
- Apriori constraints
 - Coverage
 - Overlap
- Ranking constraints
 - Significance in distribution changes
 - Accuracy
 - ROC

Setting revisited

- Mining process finished
- Result: patterns and/or rules
- Ist Question: How to select subsets?
- Answer: Constrain the sets!
- Ind Question: How?
- 3rd Question: How to efficiently use constraints? Note: disjunctions!

Syntactic constraints

Size

- (Anti-)monotone
- Techniques exist
- Patterns allowed
 - Ad hoc: filter beforehand
 - Dynamic: enumeration tree

・ロト ・聞 ト ・ 国 ト ・ 国 ト ・

Apriori constraints

• Coverage (possibly only on subset)

- (anti-)monotone
- Overlap
 - Pairwise: decided at 2-level, Apriori-like checks at deeper levels
 - Full set: (anti-)monotone
 - Average (on size): bounds, possibly based on shallower levels

Ranking constraints

Significance in distributions

- Non-overlap: upper bounds
- Overlap: "trivial" ubs, based on all P,N added, possibly lb, based on overlap
- Accuracy
 - Non-overlap: upper bounds
 - Overlap: trivial ub 1
 - Somewhat remedied by ordered lists, new problems arise

Ranking cont. - ROC

ROC

- AUC above threshold, non-overlap: upper bounds
- AUC above threshold, overlap: very trivial ubs
- Convex hull
 - Consider each pattern as single classifier, build hull: deterministic
 - Non-overlap, build one best AUC value classifier, extend hull: upper bound by slope patterns
 - Non-overlap, build classifiers parallel: upper bound based on slope, checked against competing patterns

・ロト ・雪 ・ ・ ヨ ・ ・ ヨ

ROC visualized - trivial upper bounds

Overlap effects

- On significance: possible overlap with either positives or negatives ⇒ trivial bounds
- Accuracy: possible re-classification of all current errors \Rightarrow trivial bound 1
- ROC: possible re-classification of all current instances \Rightarrow ubs (1,0), (0,1)

・ 戸 ト ・ ヨ ト ・ ヨ ト

Alternatives to Non-Overlap

- Bounded pairwise overlap: adjustment bounds, probably the looser the deeper
- Full set overlap: makes adjustment harder, bounds looser
- For both: how to decide on value?
- Ordered lists: how to order, skipping one pattern effects following, possibly explicit relation between patterns needed

・ 同 ト ・ ヨ ト ・ ヨ ト …

First Hands-On Idea

- Molfea-style mining
- Non-overlap
- ROC: AUC maximization, possibly convex hull
