

# Constrained Clustering: Why and How?

Thomas Lampert – Pierre Gançarski –  
Baptiste Lafabregue  
Université de Strasbourg

# Project

---

- Collaborative project R&T A<sup>2</sup>CNES
  - ICube Université de Strasbourg: Thomas Lampert, Baptiste Lafabregue, Pierre Gançarski
  - LIFO Université d'Orléans: Thi-Bich-Hanh Dao, Nicolas Serrette, Christel Vrain
- Objective:
  - Evaluate the applicability of constrained clustering to time-series (remote sensing images)
- Financed by: CNES

# Contents

---

- Problem background
- Types of constraints
- Overview of constrained clustering algorithms
- Application to time-series
- Experiments/Results
- Discussion of results
- Conclusions

# Problem Background

---

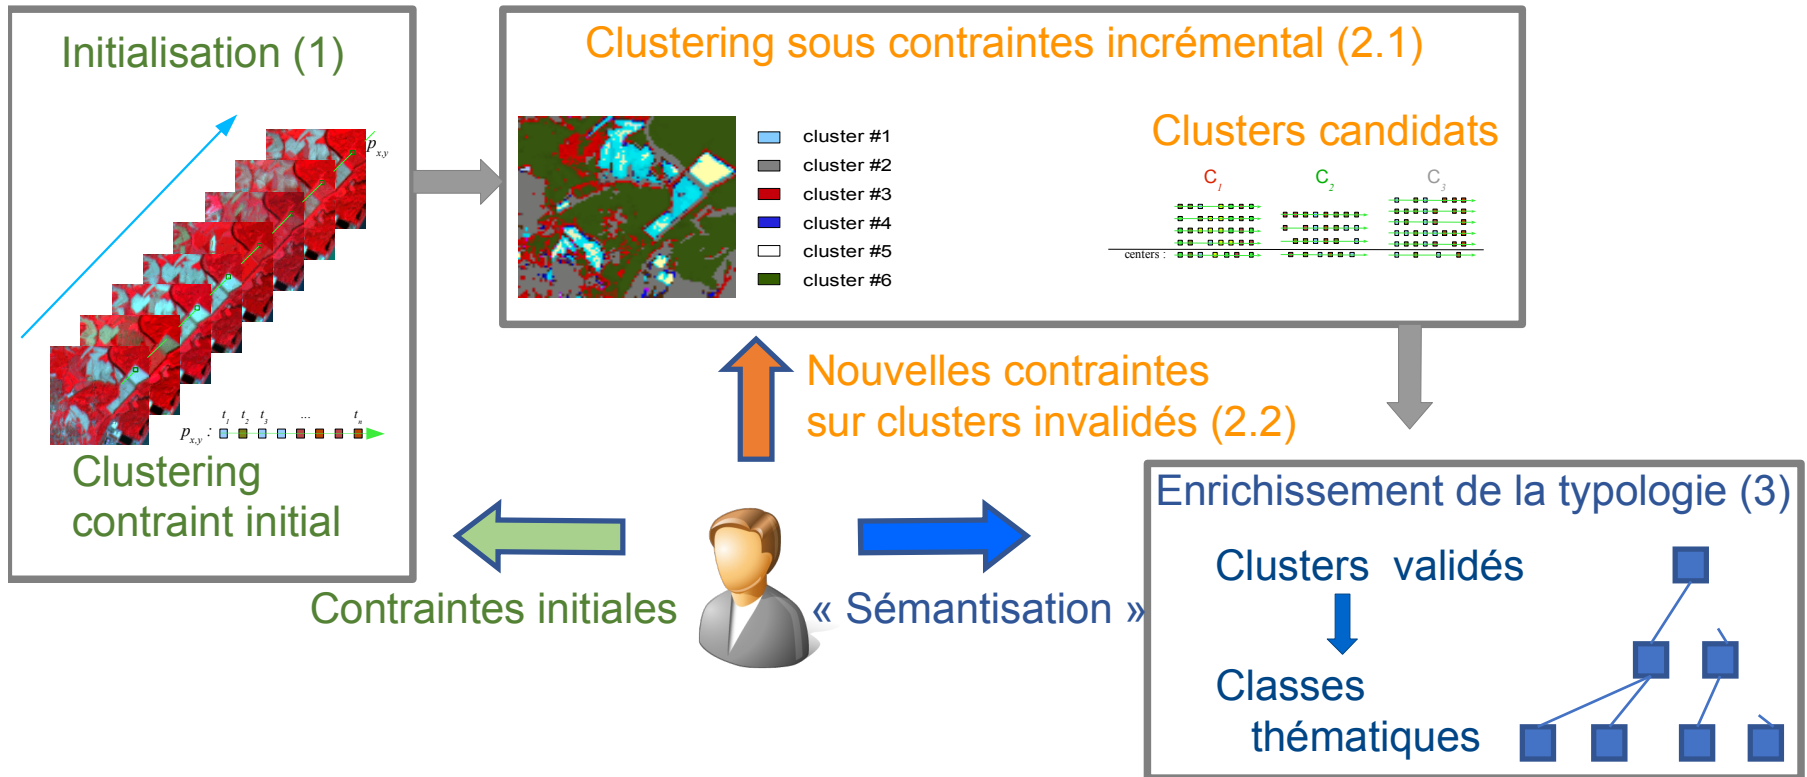

- Supervised learning (SVM, deep learning, etc)
  - Offer excellent classification performance in several areas
  - Require large volumes of training data
- Unsupervised learning (clustering, EM, etc)
  - Data exploration, offer insights into the data
  - Do not require labelled examples
  - Results may not be relevant to the user's requirements

# Problem Background

---

- Supervised learning (SVM, deep learning, etc)
  - Offer excellent classification performance in several areas
  - Require large volumes of training data
- Unsupervised learning (clustering, EM, etc)
  - Data exploration, offer insights into the data
  - Do not require labelled examples
  - Results may not be relevant to the user's requirements
- Semi-supervised learning (constrained clustering)
  - Fits between the two, large amount of unlabelled data with some information for a (generally) small subset

# Goal

# Types of Constraints: Cluster-Level

- Number of clusters
  - User: number of distinct objects

# Types of Constraints: Cluster-Level

- Absolute (or relative) maximal (or minimal) size
  - User: number of samples for each object

# Types of Constraints: Cluster-Level

- Maximum diameter  $\gamma$ 
  - User: inter class dissimilarity

# Types of Constraints: Cluster-Level

- Split: clusters must be separated by at least  $\delta$  [Davidson and Ravi, 2005]
  - User: intra class similarity

# Types of Constraints: Cluster-Level

- $\epsilon$ -constraint: each point has within a radius  $\epsilon$  at least one other point in the same cluster [Davidson and Ravi, 2005]
  - User: difficult to interpret

# Types of Constraints: Instance-Level

- Must/Cannot Link
  - User: objects of the same/different type(s)

# Constrained Clustering Algorithms

---

- 6 general approaches:
  - k-Means
  - Metric Learning
  - Spectral Graph Theory
  - Ensemble Clustering
  - Collaborative Clustering
  - Declarative

# Constrained Clustering Algorithms

- 71 papers proposing algorithms

Category	Method
<i>k</i> -Means	COP-COBWEB (Wagstaff and Cardie, 2000)

	Evolutionary Algorithm (Handl and Knowles, 2006)
	Random Forest (Zhu et al, 2016)

# Algorithms: k-Means

---

- Extends the classic k-Means algorithm
  - Check whether proposed clustering modifications violate constraints
  - Or add penalty for violating constraints
- Some guarantee constraint satisfaction
  - Problem with noisy constraints
- Iterative
  - May only find local optimum

# Algorithms: Metric Learning

---

- Uses constraints to build
  - Set of similar points from must-link
  - Set of dissimilar points from cannot-link
- These are used to learn the metric
- Each algorithm is dependent upon the metric upon which it is based (i.e. Euclidean, Mahalanobis, etc)

# Algorithms: Constrained Spectral Clustering

---

- Based on the graph cut of a graph  $G = (X, A)$ 
  - Edges described by a similarity matrix  $A$ :
    - $a_{ij} = \exp\left(\frac{-d_{ij}}{2\sigma^2}\right)$ ,
    - $d_{ij}$  — distance (dissimilarity) between  $x_i$  and  $x_j$
    - $\sigma$  — user defined parameter
- Method:
  - Construct normalised Laplacian matrix:  $L = D^{1/2}(D - A)D^{1/2}$ ,
    - $D$  — degree matrix
  - Determine the first  $k$  eigenvectors
  - Embed graph into low dimensional space (another parameter)
    - Perform k-Means in this space

# Algorithms: Constrained Spectral Clustering

---

- Integrate constraints directly into the similarity matrix
  - Force values of  $A$  to be 0 (resp. 1) for points under CL (resp. ML) constraints
  - Use constraints as regularisation factors
- Advantages
  - Clusters are not necessarily connected
  - Polynomial time calculation
  - Accepts over constrained problems
- Limits
  - No guarantee of optimality
  - Not incremental
  - No cluster level or label constraints
  - Eigenvalues for large graphs may be ill conditioned

# Algorithms: Ensemble

---

- Apply many diverse algorithms (or same with different parameters) and take consensus
- Constraints integrated:
  - each learning agent integrates them in its own fashion
    - Problem: constraints restrict diversity
  - or apply them in the consensus function
    - Builds a graph clustering approach on top, constraints guide this

# Algorithms: Collaborative

---

- Collaborative approach
  - Execute several clustering algorithms in parallel
  - Process guided by a coefficient taking into account:
    - Similarity of the results
    - Quality of the results
    - Level of constraint satisfaction

$$\begin{aligned}\gamma^{(i,j)} = & p_s \cdot \left( \frac{1}{n_i} \sum_{k=1}^{n_i} \omega_k^{(i,j)} + \frac{1}{n_j} \sum_{k=1}^{n_j} \omega_k^{(j,i)} \right) \\ & + p_q \cdot (\delta^{(i)} + \delta^{(j)}) \\ & + p_c \cdot (\theta^{(i)} + \theta^{(j)})\end{aligned}$$

# Algorithms: Collaborative

---

- Advantages
  - Clusters not necessarily convex
  - Accepts over constrained problems
  - Incremental
- Limits
  - Long processing time
  - No guarantee of optimality
  - No cluster level or label constraints

# Algorithms: Declarative

---

- Optimisation problem under constraints  $S = (X, C, F)$ 
  - $S$  — clustering to be determined
  - $X = \{x_1, \dots, x_n\}$  — data
  - $C = \{c_1, \dots, c_p\}$  — constraints
  - $F(X, C, F)$  — objective function (e.g. intra-class inertia)
- Search for a/the best solution — PPC
  - Branch-and-bound optimisation: guarantees a global optimum (if it exists) satisfying all constraints
- Large choice of constraints

# Algorithms: Declarative

---

- CPClustering [Dao et al. 2017]
  - Number of clusters: limited, i.e.  $K \in [K_{min}, K_{max}]$
  - Optimisation criteria: cluster diameter; between cluster distance; intra/inter-class inertia, ...
  - Constraints: must-link/cannot-link, size, diameter or density of clusters, ...
- Limits:
  - Processing time
  - Amount of data
  - No solution if over-constrained
  - Not incremental

# Constrained Clustering Implementations

# Experiments

---

- 5 implementations evaluated
  - COP-KMeans [Wagstaff et al, 2001]
  - Spectral clustering (adjacency modification) [Kamvar et al, 2003]
  - Spectral clustering (with regularisation) [Li and Liu, 2009]
  - SAMARAH (collaborative) [Forestier et al, 2010]
  - CPCLustering (declarative) [Dao et al, 2017]
- 9 UCR datasets (time-series)

# Experiments

- Create  $N_c$  constraints using the reference data
  - $N_c \in \{5\%, 10\%, 15\%, 50\%\}$  of the number of objects
  - Total number of possible constraints:  $\frac{N(N-1)}{2}$
  - i.e. a very small ratio (50%):  $\frac{1}{N-1}$

# Experiments

---

- Create  $N_c$  constraints using the reference data
  - $N_c \in \{5\%, 10\%, 15\%, 50\%\}$  of the number of objects
  - Total number of possible constraints:  $\frac{N(N-1)}{2}$
  - i.e. a very small ratio (50%):  $\frac{1}{N-1}$
- Validation:
  - ARI: Adjusted Rand Index
  - CSR: Constraints Satisfaction Ratio

# Results

- ARI difference: constrained ARI – unconstrained ARI

# Statistical Analysis

---

- Four potential ‘explanations’ for the loss/stagnation of quality:
  - Consistency: does the unconstrained clustering already fulfil the constraints [Wagstaff et al. 2006, Davidson et al. 2006]
  - Incoherence: amount of internal conflict between the constraints given a distance metric [Wagstaff et al. 2006, Davidson et al. 2006]
  - Cluster overlap: initial classes are not separable, i.e. overlapping
  - Algorithm: sensitivity of the algorithm to constraints

# Statistical Analysis
